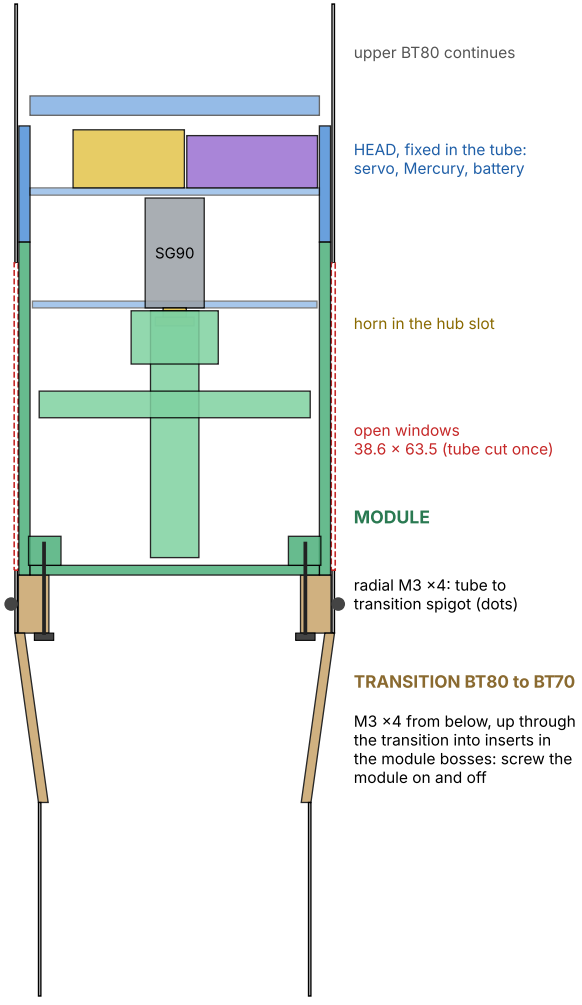
V5 quick sketch (concept, not CAD): the module screws onto the BT80 transition; the transition slides into the BT80 tube; windows left open

A closed, assembled



upper BT80 continues

HEAD, fixed in the tube:
servo, Mercury, battery

horn in the hub slot

open windows
38.6 × 63.5 (tube cut once)

MODULE

radial M3 ×4: tube to
transition spigot (dots)

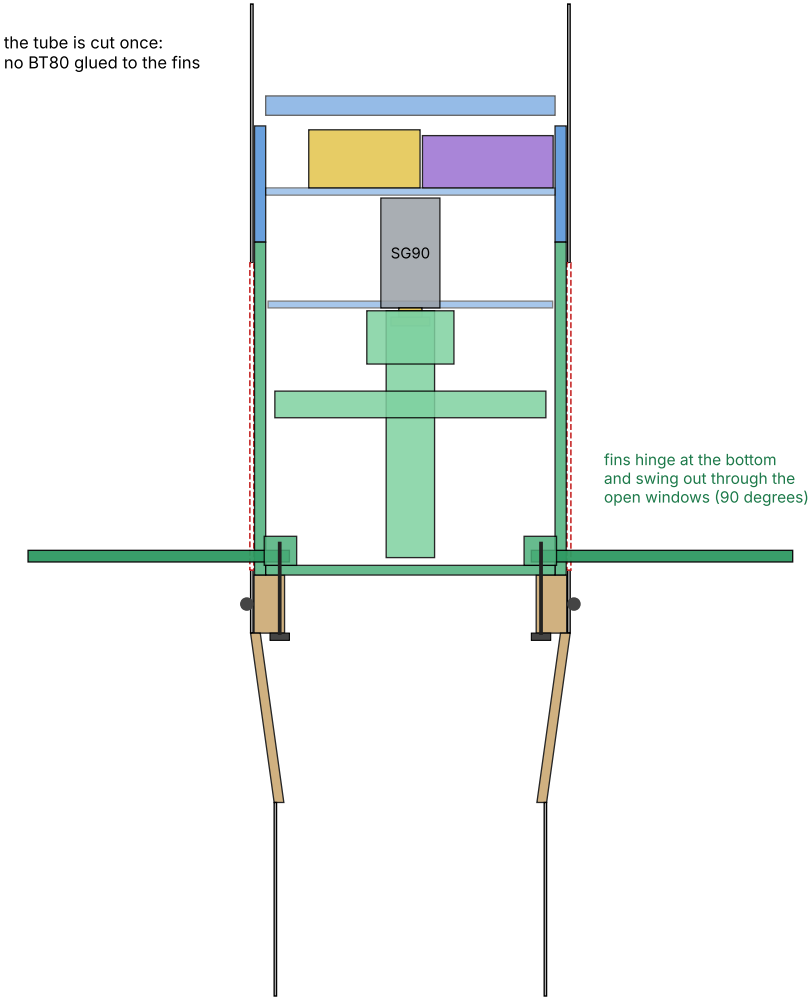
TRANSITION BT80 to BT70

M3 ×4 from below, up through
the transition into inserts in
the module bosses: screw the
module on and off

BT70 tube

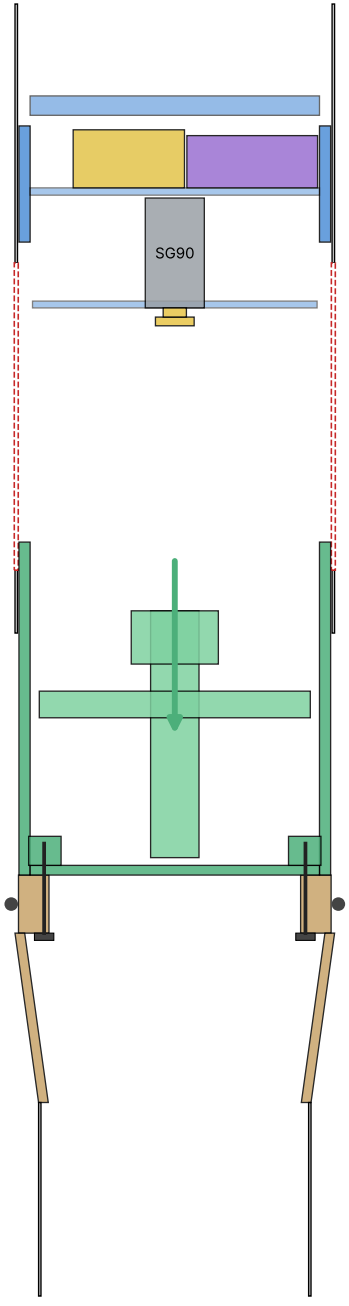
B open: fins out through the open tube windows

the tube is cut once:
no BT80 glued to the fins



fins hinge at the bottom
and swing out through the
open windows (90 degrees)

C swap: slide the module and transition out of the bottom



HEAD stays in the tube

horn pulls out of the
hub slot as the module
slides down

module + transition leave
from the bottom (tube is
fixed to the rocket above)

then, outside the tube:
unscrew the 4 M3 from below
(ball-end hex key), fit the
next module, slide it back in
